a textbook for courses related to probability and random processes for engineering students at both graduate and post graduate levels the text explains concepts with suitable examples and graphic representations since the concepts of random processes are built upon the concepts of probability and statistics one chapter is dedicated to probability and statistics

it is not so very long ago that up to date text books on statistics were almost non existent in the last few decades this deficiency has largely been remedied but in order to cope with a broad and rapidly expanding subject many of these books have been fairly big and expensive the success of methuen s existing series of monographs in physics or in biology for example stresses the value of short inexpensive treatments to which a student can turn for an introduc tion to or a revision of specialised topics in this new methuen series the still growing importance of prob ability theory in its applied aspects has been recognised by coupling together probability and statistics and included in the series are some of the newer applications of probability theory to stochastic models in various fields storage and service problems monte carlo techniques etc as well as monographs on particular statistical topics m s bartlett ix author s preface the theory of stochastic processes has developed in the last three decades its field of application is constantly expanding and at present it is being applied in nearly every branch of science so far several books have been written on the mathematical theory of stochastic processes the nature of this book is different because it is primarily a collection of problems and their solutions and is intended for readers who are already familiar with probability theory

at the end of 1960s and the beginning of 1970s when the russian version of this book was written the general theory of random processes did not operate widely with such notions as semimartingale stochastic integral with respect to semimartingale the ito formula for semimartingales etc at that time in stochastic calculus theory of martingales the main object was the square integrable martingale in a short time this theory was applied to such areas as nonlinear filtering optimal stochastic control statistics for diffusion type processes in the first edition of these volumes the stochastic calculus based on square integrable martingale theory was presented in detail with the proof of the doob meyer decomposition for submartingales and the description of a structure for stochastic integrals in the first volume general theory these results were used for a presentation of further important facts such as the girsanov theorem and its generalizations theorems on the innovation pro cesses structure of the densities radon nikodym derivatives for absolutely continuous measures being distributions of diffusion and itô type processes and existence theorems for weak and strong solutions of stochastic differential equations all the results and facts mentioned above have played a key role in the derivation of general equations for nonlinear filtering prediction and smoothing of random processes

a considerable number of problems in the statistics of random processes are formulated within the following scheme on a certain probability space q ff p a partially observable random process lj lj t 0 is given with only the second component n t 0 observed at any time t it is required based on h g s sst to estimate the unobservable state lj this problem of estimating in other words the filtering problem 0 from h will be discussed in this book it is well known that if m lj

these volumes cover non linear filtering prediction and smoothing theory and its applications to the problem of optimal estimation control with incomplete data information theory and sequential testing of hypothesis also presented is the theory of martingales of interest to those who deal with problems in financial mathematics these editions include new material expanded chapters and comments on recent progress in the field

this book is devoted to unstable solutions of stochastic differential equations sdes despite the huge interest in the theory of sdes this book is the first to present a systematic study of the instability and asymptotic behavior of the corresponding unstable stochastic systems the limit theorems contained in the book are not merely of purely mathematical value rather they also have practical value instability or violations of stability are noted in many phenomena and the authors attempt to apply mathematical and stochastic methods to deal with them the main goals include exploration of brownian motion in environments with anomalies and study of the motion of the brownian particle in layered media a fairly wide class of continuous markov processes is obtained in the limit it includes markov processes with discontinuous transition densities processes that are not solutions of any itô s sdes and the bessel diffusion process the book is self contained with presentation of definitions and auxiliary results in an appendix it will be of value for specialists in stochastic analysis and sdes as well as for researchers in other fields who deal with unstable systems and practitioners who apply stochastic models to describe phenomena of instability

this book focuses on open issues of society 5 0 a new paradigm of a society that balances a human centred approach and technologies based on cyber physical systems and artificial intelligence the book contains results of how intelligent or cyber physical systems help to improve the quality of life in society despite new challenges discusses implemented breakthrough systems models programs and methods that cover the following topics biomedicine and healthcare innovations in socio economic systems intelligent energetics advances in transport systems human centric technologies these approaches help to improve human society using cyber physical systems in a dramatically changing environment the target audience of the book are practitioners enterprises representatives scientists phd and master students who perform scientific research on the application of cyber physical systems towards society 5 0
